Zero Threshold Drains

Creative Drain **Solutions**™

Customised Drainage Solutions

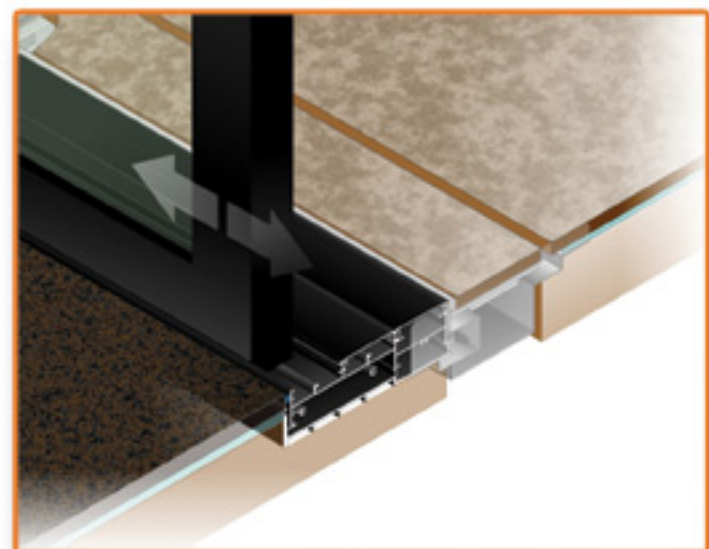

Creative Drain Solutions is proud to present our range of Zero Threshold Drains to suit many types of doors.

The Zero Threshold Drains are designed to enable an entirely flat, seamless connection between indoor and outdoor living and entertainment areas.

The Zero Threshold Drain consists of an exterior lineal drain with a custom designed, integrated sub-sill which cradles the sliding or bi-fold door or window track to be installed. The external lineal drain will act as a water barrier between the outdoor and indoor living areas. The sub-sill door track will then collect and direct the water or condensation on the interior and exterior of the doors or windows into the external drain.

In addition to providing a seamless integration of your indoor and outdoor areas, our Zero Threshold Drains also offer the following features:

- Manufactured from quality 316 stainless steel to create a strong, durable, and attractive appearance that is made to last.
- The drains are designed with built-in fall so water flows to the discharge point.
- A range of stainless steel discharge pipe sizes are available and can be positioned for connection to your storm water services

Important: Zero Threshold Drains are a secondary drain only. We do not recommend using this product as the only means to remove water from your outdoor areas. Connection to your stormwater services should be performed by a licenced plumber.

Zero Threshold Drains

Creative Drain **Solutions**™

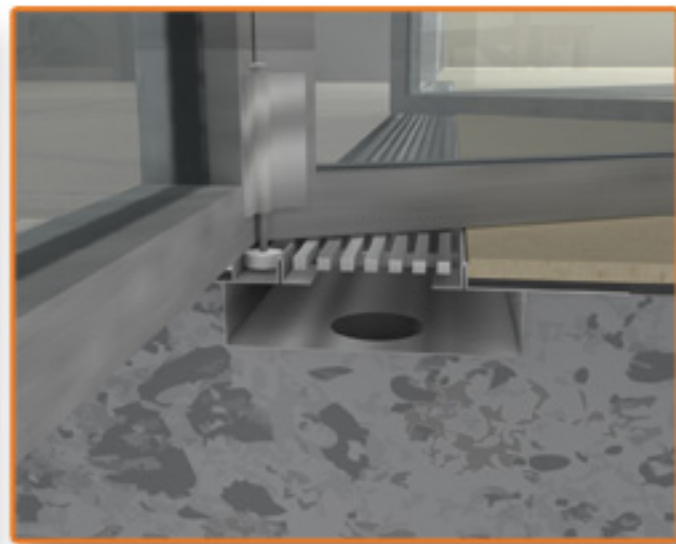

Customised Drainage Solutions

Creative Drain Solutions offer different appearances for our drains so we not only meet your drainage requirements, but the visual look you desire.

The Zero Threshold Subsill Drain can be made with our attractive 316 stainless steel bar grate, or as a slot drain or tile / paver insert to provide a stunning appearance for any application

Creative Drain Solutions can custom-design and make a drain to suit any application. This goes above and beyond custom lengths and widths, and into the fundamental design, appearance, and functionality of the drain itself. This ensures the drain will fit perfectly with any design, while always providing optimum drainage.
